

Indoor climate during the winter months

We strive to maintain an even indoor climate. All individuals can experience different temperatures, for the sake of the environment we try to keep 20 - 21 degrees inside the apartments during the winter.

The radiator feels cold

Let the knobs of the radiator be screwed up as high as possible. The system is controlled by outside / inside temperature and switches itself on and off to maintain an indoor temperature of 20 - 21 degrees. If the radiator feels cold, it does not mean there is anything wrong, but the temperature in the apartment can be sufficient.

The apartment feels cold

If your apartment feels cold, it can be due to several factors. Your housing host will then come out and make an assessment and measure the temperature in the room. If you want to make a measurement yourself, place a thermometer in the middle of the room at a height of about 1 meter. It is important that we receive a fault report so we can correct any faults in the heating system.

Furnish heat efficiently

Do not place furniture or curtains in front of the radiators in the apartment, as this will prevent the heat from spreading. Try to avoid furnishing near the window with a sofa or bed this can reduce the cold feeling. Many apartments are equipped with a fresh air intake behind the radiator from which you can experience a certain draft.

What can i do?

- Air the apartment for a maximum of 5 minutes and make sure that windows are closed when you leave home.
- Carpets / slippers can prevent the floors from feeling cold.
- Do not block air vents and vents. They are needed for good air quality and that the air circulates and heats the whole room.
- Let the sun shine in to the apartment.
- If you feel a slight draft at the windows or doors, it may be time to change sealing strips, then make a fault report to your housing host.
